

## CommSys Developer Program

If you are a software vendor in the public safety or government verticals and are interested in integrating your application(s) with CommSys' ConnectCIC™ software application, or a developer or systems integrator who wants to offer custom integration services, our CommSys Developer Program provides the necessary tools to succeed.

### Developer Program Overview

The CommSys Developer Program is ideal for anyone interested in the integration technologies of our applications, including ConnectCIC. The Developer Program is a requirement for every vendor to join during the first year of development work with ConnectCIC. Although it is highly recommended, membership after the first year will be the sole discretion of the vendor.

The program provides tools, information, community resources and developer resources to help you succeed in working with our integration technologies while minimizing support issues that developers face. This program is suited for third-party developers, system integrators, and customers who are interested in integrating their application with CommSys' ConnectCIC software applications. Minimum requirement to become a member of this program is an understanding and working knowledge of XML as well as how to make socket connections.

By seamlessly integrating your application with CommSys, the revenue potential is tremendous. Your company can maximize this opportunity by gaining access to new markets and by adding value to your own application portfolio all while meeting your customer's needs in a timely fashion.

CommSys requires the vendor to test all new state integrations using our test simulator before we will support an actual initial on-site installation. This will help us help the vendor potentially identify issues that can be solved prior to the on-site installation saving valuable time and resources. Currently this test simulator is hosted by CommSys and every effort is made to make it conveniently available to the vendors.

The Developer Program was founded upon these basic principals:

**Solid Framework** - CommSys offers a complete application built for access to State Crime Information Computers and is committed to expanding into other State, Regional and specialized interfaces as these needs exist and make sense.

**Competitive Differentiation** - Through integration with CommSys, you can now offer a complete application to expand into new markets and differentiate yourself from your competitors.

**Opportunity for Growth** - Through integration with CommSys, your offerings will receive immediate exposure to the CommSys install base, potential customers we are pursuing, and other network members, such as consultants and systems integrators.

**Community for Collaboration** - CommSys Developer Program provides a forum to share knowledge, information, and services.

The Developer Program provides the following products and services to its members:

- ConnectCIC SDK
  - Documentation
  - Software tools and downloads
  - Test simulation access
- Pre-Release Information
- Support during business hours via email and phone
- Developer Forum/Discussion Group
- Newsletter
- Access to training at discounted rates
- Direct input into future features and enhancements
- And much more!
